Rules for naming Cases

- Case names can only contain alphanumeric characters including underscore (_).
- Any other special characters or punctuation characters will be automatically removed prior to saving the case.
- All white space characters will be replaced by an underscore.

Investigation of possible adverse allergic reactions to mycoprotein ('Quorn').

Tee RD, Gordon DJ, Welch JA, Newman Taylor AJ.

PubMed
Services

Department of Occupational and Environmental Medicine, National Heart and Lung Institute, Royal Brompton Hospital, London.

Related
Resources

Mycoprotein ('Quorn') is a food produced for human consumption from *Fusarium graminearum*. Crossreactivity studies showed that mycoprotein shared multiple common allergenic determinants with *Aspergillus fumigatus* and *Cladosporium herbarum* and some with *Alternaria alternata*. There is, therefore, a potential for mould allergic patients to react adversely to inhaled or ingested mycoprotein. Mycoprotein RAST screening of mycoprotein production workers was made during a 2 year period. Two of the production workers had specific RAST binding $\geq 2\%$ but none reported symptoms. Two of 10 patients referred to hospital following vomiting and diarrhoea after ingestion of mycoprotein had a mycoprotein skin-prick test weal ≥ 2 mm but none had a significantly raised RAST. These largely negative results are important and reassuring because consumption of the product in the U.K. is now widespread and increasing.

Department of Medical Research, Veterans General Hospital, Taipei, Taiwan, Republic of China.

Related
Resources

A monoclonal antibody (MoAb P40) against the 68 kD major allergen of *Penicillium notatum* (*P. notatum*) was obtained by immunizing the mouse with a crude extract of *P. notatum*. Analysed by two-dimensional gel electrophoresis and immunoblotting, P40 reacted with two different isoforms of the 68 kD component of *P. notatum* with pIs of 5.4 and 5.5. In addition to *P. notatum*, P40 showed positive ELISA activity to *Aspergillus fumigatus* (*A. fumigatus*) but not to components of six other fungi including *Alternaria porri*, *Cladosporium cladosporioides*, *Aureobasidium pullulans*, *Fusarium solani*, *Rhizopus arrhizus* and *Candida albicans*. Analysed by ELISA, MoAb P40 also showed positive activity to two (*P. frequentans* and *P. roseopurpureum*) of the 10 other *Penicillium* species and two (*A. terreus* and *A. flavus*) of the four other *Aspergillus* species tested. SDS-PAGE and immunoblotting studies demonstrated P40 positive reactivity to components with MW of about 67 kD in all these *Penicillium* and *Aspergillus* species with positive ELISA activity to P40. Furthermore, immunoblotting activity of MoAb P40 to the 67 kD component of *A. niger* was also observed. The epitope of the 68 kD allergen of *P. notatum* recognized by MoAb P40 was resistant to treatment of periodate oxidation with concentration of NaIO₄ up to 20 mM. This MoAb may thus be useful in the characterization and purification of the 68 kD allergen from crude extracts, and in the molecular cloning of allergen genes.
